

Simon GRASMAN, CTO of REDstack BV. Already working 12 years on the development of Blue Energy, of which 11 years at REDstack. Master degree from the University of Groningen, studied Blue Energy for my master thesis research at Wetsus working with dr. Jan Post. After completing my master thesis, continued working on the development of Blue Energy at REDstack. Starting as a Process Engineer, developing the Afsluitdijk Pilot Facility project, resulting in the largest Blue Energy pilot installation in the world, running on real sea and river water (the pilot installation was opened in 2014 by H.M. King Willem Alexander.) Next to the Afsluitdijk project, involved in several other research and development projects working on Blue Energy and related technologies. When starting at REDstack, I was the first full-time employee, so next to developing the technology also helped building the company from the beginning.
